1 Summary

This records every change made in the current round of work. Across the codebase:

MEASURE	COUNT
Files changed	115
Lines added / removed	6,368 / 10,128
Files deleted	27
Migrations	40 → 23
Vue screens restyled	25

The work falls into six themes: a consistent design system, one new module, three features removed, a migration clean-up, and the defects found along the way.

2 Design system and branding

Every screen was moved onto the three-tier Tailwind theme so colours come from semantic tokens rather than raw palette classes.

TOKEN	REPLACES
bg-canvas / bg-surface	bg-gray-50 / bg-white
text-text / text-text-muted	text-gray-900 / text-gray-500
bg-accent-solid	bg-blue-600, bg-green-600, bg-indigo-600
text-danger / bg-status-*	text-red-600 / coloured badge fills

The shared screen pattern

Every list screen now follows one layout: a title-bar card with the primary action, a single bordered card holding filters and results, notched-outline filter fields, a **Filter/Clear** pair, a table that becomes stacked cards below `lg`, and pagination inside the card.

Screens restyled

My Records — Attendance, Time Entries, Leave Requests, My Shift.

My Team — Team's Attendance, Team's Time Entries, Team's Leaves, Team's Shift.

HR Modules — Role Management, HR Announcements, Active Associates.

Settings — Projects, Clients, Leave Types, Shifts.

Plus Profile, Dashboard and the shared Layout.

Renames

WAS	NOW
My Leaves	Leave Requests
My Standup	Time Entries
My Team's Stand Up	Team's Time Entries
My Team's Attendance / Leaves / Shift	Team's Attendance / Leaves / Shift
Shift Management	Shifts
Manage Roles	Role Management

Other interface changes

- Status chip rows replaced by a single Status dropdown with live counts, on Leave Requests, Team's Leaves and Team's Shift.
- Reason and Notes clamp to two lines with the full text on hover. The tooltip is fixed-positioned so the table's horizontal scroll cannot clip it, and only appears when the text is genuinely cut off.
- Leave attachments open in a preview modal — images inline, PDFs in a frame — instead of downloading.
- Profile gained a title bar with an Edit Profile button and lost the active / online indicator.
- The Dashboard approval modal now shows a submitted timesheet as a full read-only week grid rather than an hours total.
- Two native `confirm()` dialogs (Shifts, HR Announcements) replaced with branded modals.

3 Time Entries (new module)

A NetSuite-style weekly timesheet replaced the old stand-up feature.

- **New tables** — `time_types`, `timesheets`, `timesheet_entries`.
- **Time Entries** — the personal grid: project, task, time type, memo and seven day columns, with draft → pending → approved.
- **Team's Time Entries** — a weekly roster that includes people who never started a sheet, drillable into one person's read-only grid, with CSV export.
- Approval lands in the Dashboard Requests queue alongside leaves and shift changes.

4 Overtime removed

The company does not file overtime; compensatory time off (CTO) is granted directly on leave credits instead. Removed: the `overtimes` table, its model, policy, resource, request, seeder, three controllers, three Vue screens and the dead `'overtime'` value in the `for_approvals` type enum.

5 Glip and RingCentral removed

Glip is no longer used, so the integration was removed in full.

- `RingCentralService` deleted — roughly 800 lines and 13 send methods.
- Call sites removed from `AttendanceService` (clock in, clock out, break start, break end), `DashboardController` (leave and correction approve / reject), `MyAttendanceController`, `MyLeavesController`, `MyStandupController`, `AuthController` and the auto-approve command.
- `glip_url` dropped from both `users` and `projects`, and removed from the user screens, resource, form requests and seeders.
- The `ringcentral` block removed from `config/services.php`.

There are now no outbound notifications. Attendance, leave and approval events no longer notify anyone. The login magic link still goes out by **email**, so sign-in is unaffected. Two messages that claimed a notification had been sent were corrected.

6 Project Manager removed

The role does not exist at the company. `pm_id` and the `projectManager` relation were removed from the model, resource, service eager loads, both form requests, the seeder and the Projects screen, and the column was dropped.

Side effect worth knowing: the seeder previously *skipped* any project whose project manager could not be found. With the check gone it now seeds all 14.

7 Migration consolidation

Since the project is pre-production, alter-table migrations were folded into the `create` migrations they amend, taking 40 files down to 23 — all now `create_*`.

FOLDED INTO	WHAT MOVED IN
<code>create_users_table</code>	<code>employment_status</code> ; <code>glip_url</code> removed
<code>create_projects_table</code>	<code>pm_id</code> and <code>glip_url</code> removed
<code>create_attendances_table</code>	<code>time_in/time_out</code> widened to <code>datetime</code>
<code>create_leaves_table</code>	<code>cancelled_status</code> , <code>cancelled_at</code> , <code>cancelled_by</code>
<code>create_attendance_corrections_table</code>	The two lunch-break columns
<code>create_leave_credits_table</code>	PTO (days) and CTO (hours)
<code>RolePermissionSeeder</code>	All 16 permissions from 4 permission migrations

Five overtime migrations were deleted outright — the table was created, altered three times and then dropped, which is a no-op on a fresh database. Two of those five were byte-identical duplicates committed 32 seconds apart.

Verified by snapshotting all 375 columns across 40 tables, rebuilding from scratch, and diffing: **375 columns before and after**, with only the two intended differences.

8 Bugs found and fixed

AREA	DEFECT AND FIX
Sidebar squashed	Flexbox min-width: auto let the nav collapse to 16px on wide tables. Fixed with <code>shrink-0</code> on the aside and <code>min-w-0</code> on main.
Leave date filter	Used containment, so a range inside a longer leave returned nothing. Changed to an overlap test in four places.
“All” status count	Showed the paginated total of the selected status instead of the unfiltered total.
Time Entries week stepper	Next did nothing and Previous skipped a week. <code>toISOString()</code> converted local midnight Monday to Sunday UTC; because the API snaps to the Monday of the week, that cancelled the forward step and doubled the backward one. Fixed with local-time date helpers.
Time Entries permissions	Permission migrations granted roles <i>before</i> the seeder created them, so the grants no-op'd and the seeder then overwrote them. Only Super Admin could open Time Entries after any fresh seed. Fixed by moving the permissions into the seeder.
Attachment preview	Rendered the application's own dashboard: <code>public/storage</code> had never been linked, and the seeder referenced a PDF it never created. Both fixed.
Required-field validation	Moving modal buttons into a fixed footer put them outside the form, so blank submits reached the server. Restored with the <code>form</code> attribute.
Export button	Dropped when Team's Stand Up was replaced; restored as a week-scoped team export.
Filter responsiveness	The leave filter row broke between 640 and 1440px. Fixed with wrapping and fixed field widths.
HR Announcements overflow	The New Announcement button overflowed a 375px screen; its label now shortens.
Dead code	Duplicate methods, an unreachable “previously sent back” banner, and several unused helpers removed.

9 Known issues not fixed

Found during this work, reported, and deliberately left alone:

- **Announcement thumbnails leak titles to a third party.** The seeder writes image paths for files it never creates, and the dashboard falls back to `ui-avatars.com` with the announcement title in the query string.
- **Attendance month filter** silently clears a typed date range.
- **`attendance_date` serialises as a UTC timestamp**, so browsers outside the app timezone mislabel rows by a day. Three components read it.
- **Team's Shift has no `applied` filter option**; those rows appear only under All Statuses.
- **User creation requires a resolvable email domain** (`email:rfc,dns`), so seeded `.test` accounts cannot be created through the UI.
- **`for_approvals` switch handles values its enum forbids** — `attendance` and `shift` are unreachable branches.
- **No HR screen for Time Types** — the table, model and read API exist, the management screen does not.

10 What this means for your database

A rebuild is required. Because alter-table migrations were folded into the create files, a database that already ran the old set is inconsistent with the files. `php artisan migrate` will not reconcile it — run `php artisan migrate:fresh --seed`.

Anyone with a local copy of the project needs to do the same.

Do not re-run `LeaveSeeder` on its own. It is not idempotent across days: relative dates shift and it duplicates leaves, and deleting the duplicates does not reverse the leave-credit observer. Use `migrate:fresh --seed`.
