1 What the module is

My Records is everything an associate files or reviews about themselves. Four screens sit under it, and each has an exact counterpart under **My Team** that a supervisor uses to review the same data for their direct reports.

SCREEN	ANSWERS	TEAM COUNTERPART
Attendance	When did I clock in and out?	Team's Attendance
Time Entries	What did I spend the week on?	Team's Time Entries
Leave Requests	What leave have I filed?	Team's Leaves
My Shift	What shift am I on, and can I change it?	Team's Shift

2 Attendance

A read-only history of the rows the Dashboard clock creates. One row per day, with time in, time out, break totals and worked hours.

- **Filters.** A month selector and a free date range, applied with **Filter** and reset with **Clear**.
- **Export.** `GET /api/user/my-attendance/export` streams a CSV of the current filter, behind its own `my attendance` permission.
- **Corrections.** If a row is wrong, an associate raises an attendance correction. It records the proposed time in, time out and lunch window, and goes to the supervisor's Dashboard queue for approval.

Known rough edge. Choosing a month silently clears a date range you already typed. The two filters are alternatives, but the screen does not say so.

3 Time Entries

The weekly timesheet, modelled on NetSuite: one row per project / task / time type, seven day columns, and a row total. A week moves **DRAFT** → **PENDING** → **APPROVED**, and a sent-back week returns to draft for editing.

This module has its own document. See **Time Entries — How It Works** for the grid, the lifecycle, the data model and the supervisor view.

Weeks run Monday to Sunday. The API snaps any date you give it to the Monday of its week (`Timesheet::weekStartFor`), so a timesheet is always addressed by its Monday.

4 Leave Requests

Where leave is filed and tracked. The screen opens with the five credit tiles, then a filter row, then the table.

COLUMN GROUP	HOLDS
Leave Type	The type chip — VL, SL, PTO, BDO and so on
Start / End / Duration	Dates plus All Day, a half day, or a custom time window
Reason / Notes	Clamped to two lines; hover shows the full text
Attachment	Opens in a preview modal rather than downloading
Submitted / Status / Action	When it was filed, where it stands, what you may do

Filing rules

- Leave may be backdated by at most **30 days**; the date inputs enforce the floor.
- End date may not precede start date.
- **Sick Leave (WITH Medical Certificate)** requires an attachment — the form blocks submission without one.
- **Edit** is available only while `pending`.
- **Cancel** is available while `pending` or `approved`, and asks for a reason that is stored on the row.

Status filter

A single dropdown — All / Pending / Approved / Rejected / Cancelled — with a live count beside each. The All count is the unfiltered total, deliberately not the paginated total of whichever status is selected.

Date filtering is overlap, not containment. Filtering 26–26 October returns a leave running 25–27 October, because the range test is `end_date ≥ from AND start_date ≤ to`. Containment would have hidden it.

5 Leave credits and the observer

Credits live in one `leave_credits` row per user per year, and are moved automatically by `LeaveObserver` as a leave changes state — never by hand from this screen.

EVENT	EFFECT
Leave created	Days are added to the matching <code>*_pending</code> bucket
Approved	Days move from <code>*_pending</code> to <code>*_used</code>
Rejected or cancelled	Days come out of <code>*_pending</code>
Deleted	Pending days are released

Do not move leave rows behind the observer's back. Force-deleting leaves in the database does not reverse the credit arithmetic, which leaves `used` and `pending` overstated. Rebuild with `migrate:fresh --seed` instead.

Credit buckets

BUCKET	UNIT	NOTES
VL	Days	Carries over; carryover is tracked separately
SL	Days	Does not carry over
PTO	Days	Same shape as VL and SL
CTO	Hours	Granted by HR; this is the company's compensatory-time concept — there is no overtime filing
Birthday	Days	One per year, subject to a tenure check

6 My Shift

Shows the shift currently assigned and the history of changes. An associate may request a different shift: they pick from the available shifts, give an effective date and a reason, and the request lands in their supervisor's Dashboard queue.

`applied` marks a request whose effective date has arrived and whose shift is now live on the user record.

7 Shared screen conventions

Every screen in the module is built the same way, so behaviour transfers:

- A title bar card holds the heading and the primary action.
- Filters and results share one bordered card; filter fields use a notched outline with the label sitting on the border.
- Filters apply on **Filter**, not as you type, and **Clear** resets them.
- Tables scroll horizontally below their minimum width; below `lg` they become stacked cards rather than shrinking.
- Long text is clamped to two lines with the full value on hover.
- Pagination sits inside the table card.

8 API reference

ATTENDANCE

VERB	PATH	PERMISSION
GET	<code>/api/user/my-attendance</code>	view my attendance
GET	<code>/api/user/my-attendance/export</code>	export my attendance

TIME ENTRIES

VERB	PATH	PERMISSION
GET	/api/user/time-entries	view my time entries
GET	/api/user/time-entries/week	view my time entries
GET	/api/user/time-entries/projects	view my time entries
GET	/api/user/time-entries/time-types	view my time entries
POST	/api/user/time-entries/{sheet}/entries	create my time entries
PUT	/api/user/time-entries/{sheet}/entries/{id}	edit my time entries
DELETE	/api/user/time-entries/{sheet}/entries/{id}	delete my time entries
POST	/api/user/time-entries/{sheet}/submit	submit my time entries

LEAVE REQUESTS

VERB	PATH	PERMISSION
GET	/api/user/my-leaves	view my leaves
GET	/api/user/my-leaves/stats	view my leaves
GET	/api/user/my-leaves/types	view my leaves
POST	/api/user/my-leaves	create my leaves
PUT	/api/user/my-leaves/{leave}	edit my leaves
PUT	/api/user/my-leaves/{leave}/cancel	cancel my leaves

MY SHIFT

VERB	PATH	PERMISSION
GET	/api/user/my-shift/history	view my shift
GET	/api/user/my-shift/requests	view my shift
GET	/api/user/my-shift/available-shifts	view my shift
POST	/api/user/my-shift/request-change	request shift change

9 Permissions

All six roles hold the full My Records set — attendance, time entries, leaves and shift. The module is personal data, so the scope is always the signed-in user; there is no permission that widens it to someone else's records. Seeing another person's data is what **My Team** and the HR modules are for.
