1 What the module is

Settings holds the four reference lists the rest of the application selects from. Nothing here is transactional — these are the options that appear in other modules' dropdowns, and changing one changes what everybody can choose.

LIST	FEEDS	TABLE
Projects	Time entry lines	projects
Clients	Projects	clients
Leave Types	Leave requests, proxy leaves	leaves_type
Shifts	User accounts, shift change requests, attendance	shifts

2 Projects

The work people book time against. A project row carries a name, its client, a project type and a description.

FIELD	NOTES
Project Name	Required
Client	Required; drawn from the Clients list
Project Type	Required; e.g. Web Application, Mobile Application, Data & Analytics
Description	Optional; clamped to two lines in the table, full text on hover

Filters cover a name search, client, project type and page size.

No project manager field. The company does not have a project manager role, so `pm_id` and its relation were removed from the model, API, validation and seeder. The Glip webhook column went with it.

3 Clients

The companies projects belong to: name, parent company, contact name, contact number and description. Each row shows a live count of the projects attached to it.

4 Leave Types

The kinds of leave that can be filed. Each has a display name and a short code; the code is what ties a type to a credit bucket.

CODE	DRAWS FROM
VL	Vacation leave credits
SL	Sick leave credits
EL	Emergency leave
BL	Birthday leave — one per year, subject to tenure
ML / PL	Maternity / paternity
LWOP	Leave without pay — draws no credit

One name is load-bearing. Leave Requests decides an attachment is mandatory by testing whether the type name contains `WITH Medical Certificate`. Renaming that type past the phrase silently turns off the requirement.

5 Shifts

The working windows an associate can be assigned to. A shift is a type (`day` or `night`) plus a start and end time; duration is derived, and a window crossing midnight is handled by adding 24 hours rather than reporting a negative span.

The screen opens with three summary tiles — Total, Day and Night — which count the whole roster and are deliberately unaffected by the filters below. Each row shows how many users are on that shift.

6 What depends on these lists

7 Deletion rules

Each list guards deletion differently, according to what would break:

LIST	RULE
Clients	Blocked while projects are attached; the dialog names the count and asks you to reassign first
Shifts	Delete is disabled while users are assigned; the button explains why on hover
Projects	Soft-deleted, so historical time entries keep their reference
Leave Types	Restricted at the database level — a type in use cannot be removed

8 API reference

VERB	PATH	PERMISSION
GET	/api/user/projects · /form-data	view projects
POST/PUT/DELETE	/api/user/projects, /{project}	create edit delete projects
GET	/api/user/clients	view clients
POST/PUT/DELETE	/api/user/clients, /{client}	create edit delete clients
GET	/api/user/leave-types	view leave types
POST/PUT/DELETE	/api/user/leave-types, /{id}	create edit delete leave types
GET	/api/shifts	view shifts
POST/PUT/DELETE	/api/shifts, /{shift}	create edit delete shifts

9 Permissions

ROLE	SETTINGS ACCESS
Super Admin	Full on all four lists
Admin	Full on all four lists
HR	Full on all four lists
Manager	View only
Team Lead, Employee	No access; they consume the lists through dropdowns elsewhere
